Protein subcellular localization

- A protein's subcellular localization <==> function
- Spatial temporal variation of a protein's location results from genetic and environmental perturbations
- High-throughput imaging: image classification
 - proteins are fluorescently labeled to track their locations within a cell;
- Why automating?
 - Manual: labor-intensive and error-prone.
- Large, but not so large, amounts of data: deep learning? others?

DeepYeast (11-layer CNN) Model structure

- A 11-layered CNN; similar to the first few layers of VGG-19;
- VGG-19 was trained on the (ImageNet) ILSVRC dataset consisting of natural objects, aircraft, etc.
- Several papers: similar CNNs for the current problem.

Result

Base CNN (DeepYeast) performance on the subcellular localization dataset

The test accuracy is 0.8512 (vs 0.8671 in the paper).

Motivation

Figure 2: Poorer performance with deeper layers (He et al., 2016)

Figure 3: Convolution layer learns the residual features left by the identity skip connection/shortcut

Residual neural networks

- Convolutional layer blocks; no fully-connected layers;
- Identity shortcut was shown to perform well.
- We tried 18- and 50-layered ResNet, Res18 and Res50.

CNNs and microscopy images

June 5, 2018 13 / 20

э

(日)

Test accuracy of residual neural networks

- Res18 and Res50 performed better than their plain versions;
- Plain 50 worse than plain 18; but Res50 better than Res18;
- More benefits with 50 layers.

Network	Training time	Test accuracy
plain 18	1.75 h	0.8432
Res 18	1.75 h	0.8708
plain 50	13 h	0.8190
Res 50	12.75 h	0.8856

- E

Definition and advantages

- The last one or few layers of a pretrained neural network are replaced by new classifiers.
- More accurate and faster (vs. without feature extraction).

Mengli Xiao, Wei Pan (UMN)

(日) (四) (日) (日) (日)

Use trained network as a feature extractor

- Replace the last fully-connected layer of the base CNN model (DeepYeast) with a random forest and an XGBoost:
 - Compared to using vectorizing-image input, the test accuracy is improved (0.85 vs 0.6)
 - Faster: with 512 extracted features vs the original 12288 $(= 64 \times 64 \times 3)$ features
- Replace all the fully-connected layers of the VGG-19 model with new fully-connected layers, a random forest and an XGBoost respectively,
 - Very quick compared to training a neural network from scratch; decent test accuracy (0.73, 0.66, 0.72)

Summary

Table 5: Comparison of accuracy between different methods

Network	Training time	Test accuracy
DeepYeast (11-layer CNN)	6 h	0.851
CNN (18-layer)	1.75 h	0.843
Res18	1.75 h	0.871 - 0.891
ResNet 18 (He et al., 2016)	2.45 h	0.853
CNN (50-layer)	13 h	0.819
ResNet 50 (He et al.2016)	12.75 h	0.886
Wide ResNet (widening factor 2)	46 h	0.853
Random Forest (v-images; 1000 trees)	1.68 h	0.600
XGBoost (v-images 800 trees)	10 h	0.6
Feature extraction by DeepYeast:		
Random Forest	10 min	0.850
XGBoost	1 h	0.840
Feature extraction by VGG-19 (transfer learning):		
FC layers	3 min	0.730
Random Forest (800 trees)	12 min	0.660
XGBoost (1000 trees)	14 h	0.722

A D N A B N A B N A B N

Discussion

- CNNs performed best, though not a thorough evaluation! Why? images, a large dataset, ...
- Other statistical methods: RF, Boosting, SVM good, but not tailored to images...
 - BUT, some new stat methods: could not even run ...

Discussion

Acknowledgment

- Funded by NIH, NSF.
